motivation

Impact of Galactic Cosmic Rays

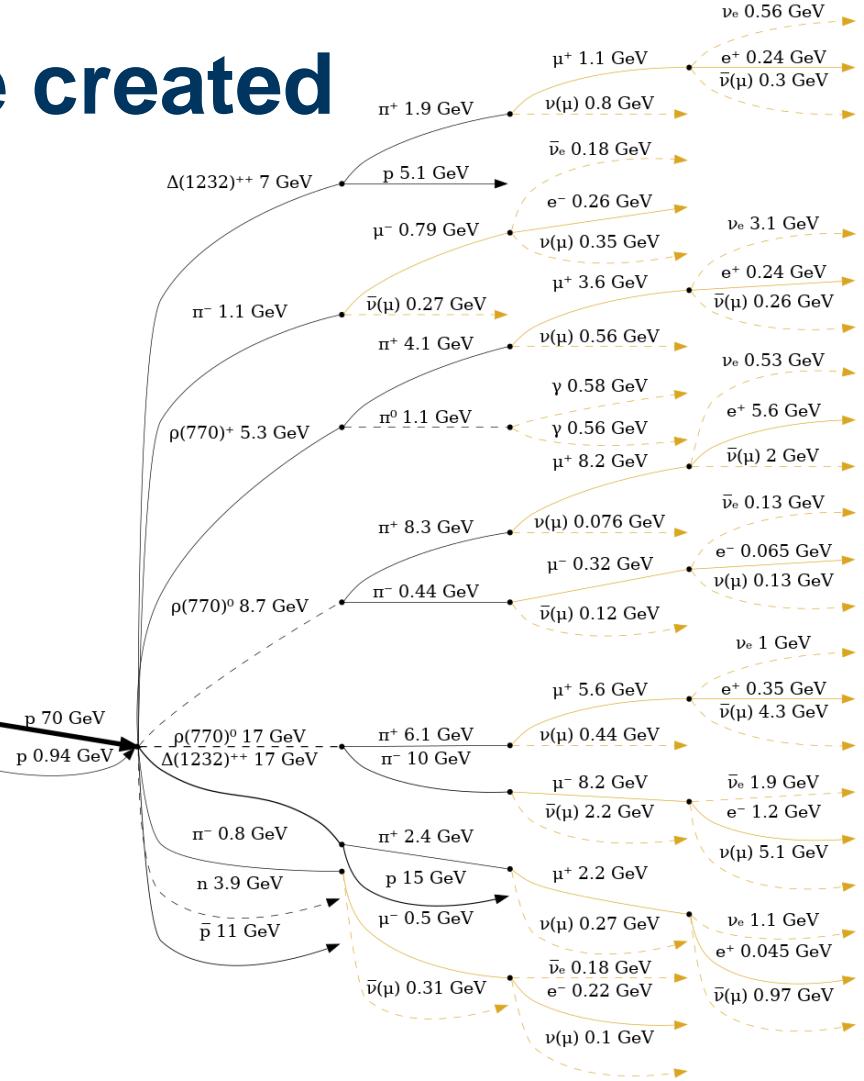

Impact of Galactic Cosmic Rays

IceCube collaboration, Science 380, 6652

bunch of particles can be created

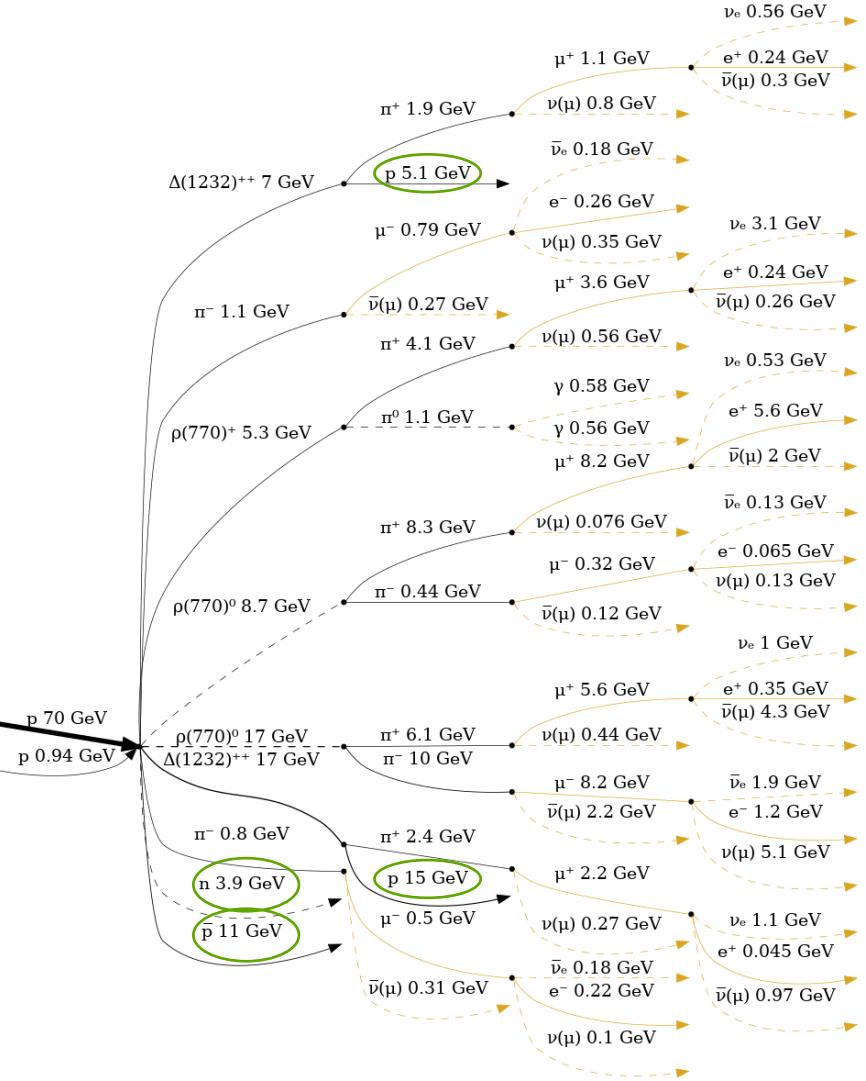

- $p + p \rightarrow \pi^0 \rightarrow \gamma\gamma$
dominant process for diffuse galactic gamma-ray emission
- $p + p \rightarrow \pi^\pm \rightarrow e^\pm \nu_e \nu_\mu$
production of (Galactic) neutrinos as seen in IceCube
- $p + p (A) \rightarrow \bar{p}, \bar{n}, \overline{He}$
seen by AMS-02

Final state of interaction

- e^-, e^+
- $\nu_e, \bar{\nu}_e$
- $\nu_\mu, \bar{\nu}_\mu$
- p, \bar{p}, n, \bar{n}

includes up scattered proton
and primary after interaction

Crossection models

cross-section: inclusive and inelastic

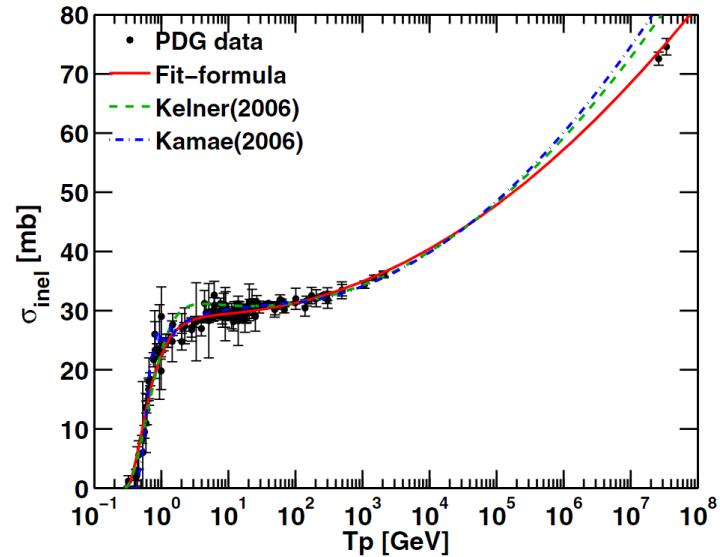

Inelastic cross-section: Kafexhiu+ (2014)

$$\sigma_0(T_p) = [30.7 - 0.96 \log(x) + 0.18 \log^2(x)] \times [1 - x^{1.9}]^3 \text{ mb}$$

$$x = \frac{T_p}{T_p^{th}} ; T_p^{th} = 2m_\pi + \frac{m_\pi^2}{2 m_p} \approx 0.2797 \text{ GeV}$$

→ total interaction probability:

$$p = n_{gas} \cdot \sigma \cdot \Delta s$$

cross-section: inclusive and inelastic

Differential inclusive cross-section:

For each secondary species s

$$\frac{d\sigma^{(s)}}{d\epsilon}(T_p, \epsilon) = \sigma_0(T_p) \cdot \frac{dN_s}{d\epsilon}$$

cross-section: inclusive models

Name	proj	targ .	Incl. secondaries	Primary energy	Secondary energy
Kelner+ (2006)	p	p	$\gamma, e, \nu_e, \nu_\mu$ or π	$0.1 - 10^5$ TeV	$10^{-3} \leq \frac{\epsilon}{T_p} \leq 1$
Kafexhiu+ (2014)	p	p	γ	$T_p < 512$ TeV	As primary
AAfrag Kachelrieß+ (2019)	p, He, C, Al, Fe, \bar{p}	p, He	$\gamma, e, \nu_e, \nu_\mu, p,$ $n, \bar{d}, {}^3\text{He}, {}^3\bar{\text{H}}$	Proton: $5 - 10^{11}$ GeV	As primary
ODDK Orusa+ (2022, 2023)	$p, {}^2_1\text{H}, {}^3_2\text{He}, {}^4_2\text{He},$ ${}^{12}_6\text{C}, {}^{13}_6\text{C}, {}^{14}_7\text{N},$ ${}^{15}_7\text{N}, {}^{16}_8\text{O}$	p, He	e^\pm, γ	$e^\pm: 10^{-4} - 10^3$ TeV $\gamma: 10^{-4} - 10^4$ TeV	$10^{-5} - 10$ TeV $10^{-5} - 10^2$ TeV

CRPropa Plug-In

Precalculated data – for each secondary

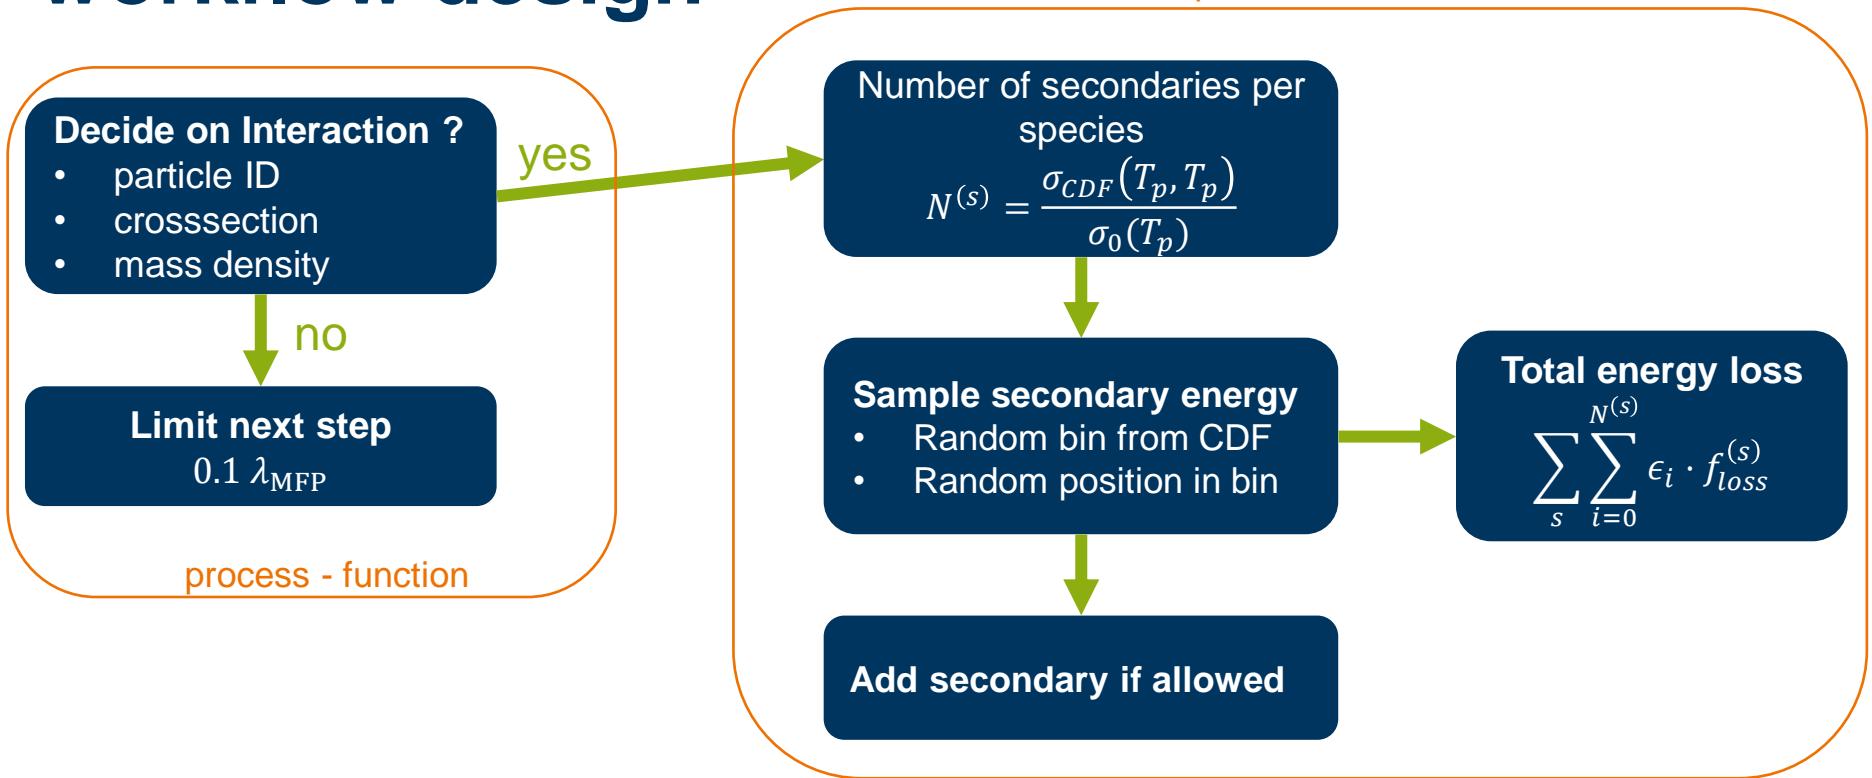

- 2D – table with a CDF

$$\sigma_{\text{CDF}}^{(s)}(T_p, \epsilon) = \int_{E_{th}}^{\epsilon} d\epsilon' \frac{d\sigma^{(s)}}{d\epsilon'}$$

- Correction factor for missing energy loss $f_{loss}^{(s)}$
- Data are precalculated and collected with a config file
- Individual cross-section can be loaded and added to the module

workflow design

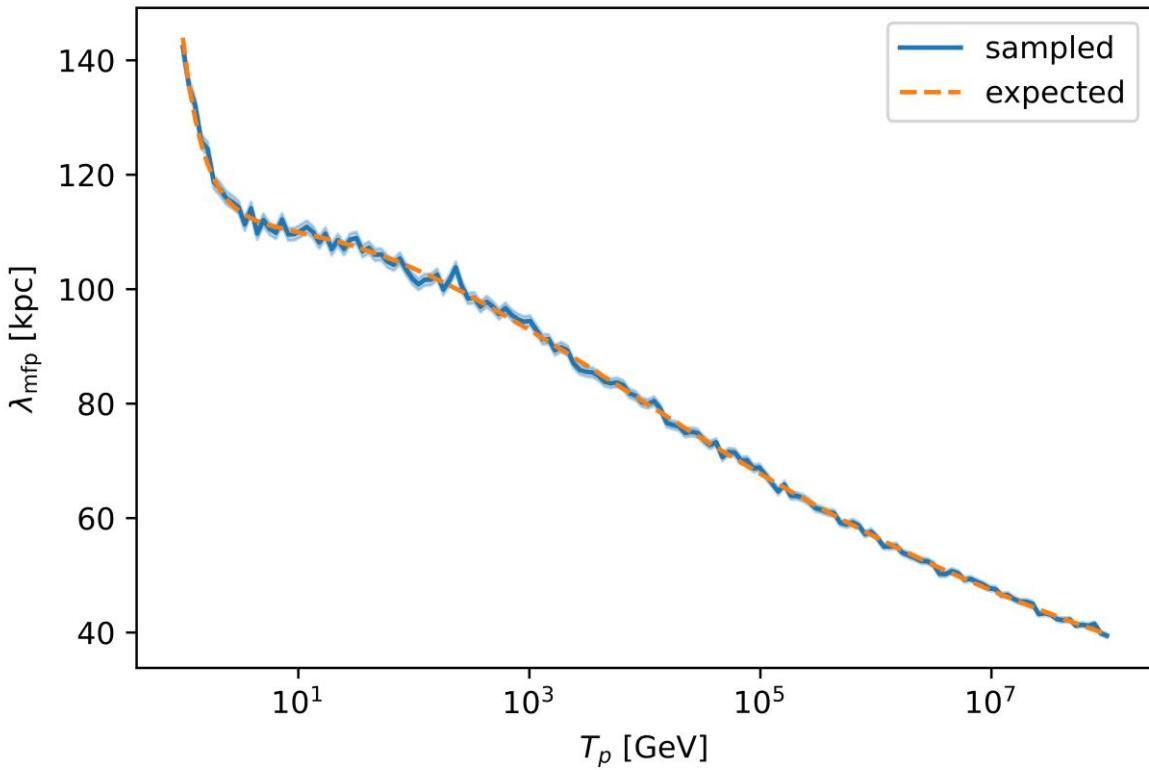

perform interaction

testing
mean free path

Mean free path

- 10^4 primary protons per energy
- Constant target density $n_H = 10^8 \text{ m}^{-3}$
- Fixed propagation step $\Delta s = 100 \text{ pc}$
- Detect length for first interaction

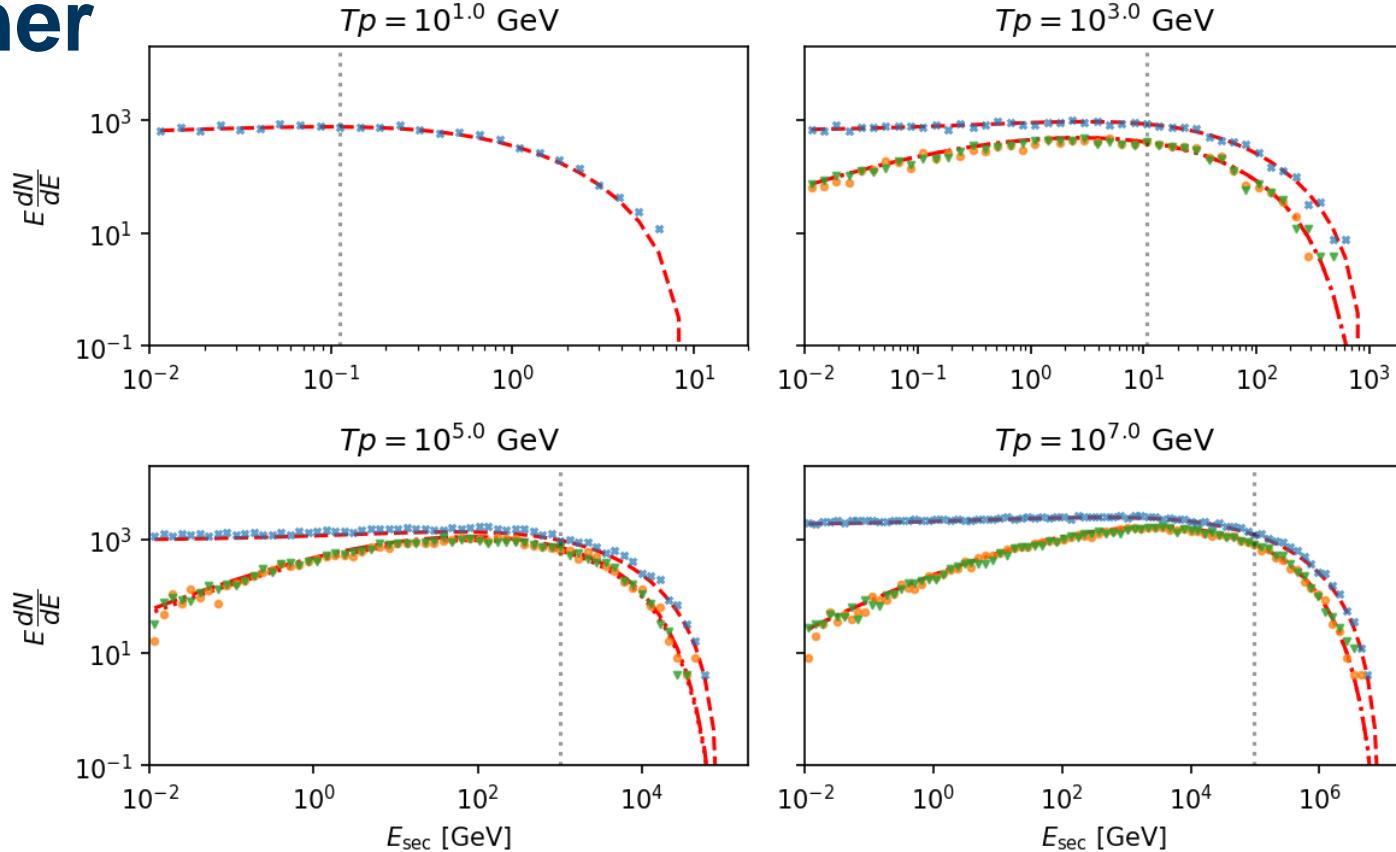

testing
yields

Simulation setup for testing yields

- Fixed primary energy T_p
- 10^5 calls of `performInteraction`
- Calculate spectra of secondary particles
- Compare to shape of differential cross section
(normed at $10^{-2} T_p$)

Kelner

model: Kelner
• γ
• e^-
• e^+
— γ Kelner
- - - e^- Kelner
- - - e^+ Kelner

testing
energy loss

Energy loss from crossection

Total energy loss per unit time:

$$-\frac{dE}{dt}(T_p) = \int_{E_{th}}^{T_p} d\epsilon \nu \epsilon n(\vec{r}) \sum_s \frac{d\sigma^{(s)}}{d\epsilon}(T_p, \epsilon)$$

Approximation by Krakau & Schlickeiser (2015)

$$\frac{dE}{dt}(T_p) \approx 3.85 \cdot 10^{-16} \cdot \left(\frac{n}{10^6 \text{ m}^{-3}} \right) \cdot T_p^{1.28} \cdot (T_p + 200 \text{ GeV})^{-0.2} \text{ GeV/s}$$

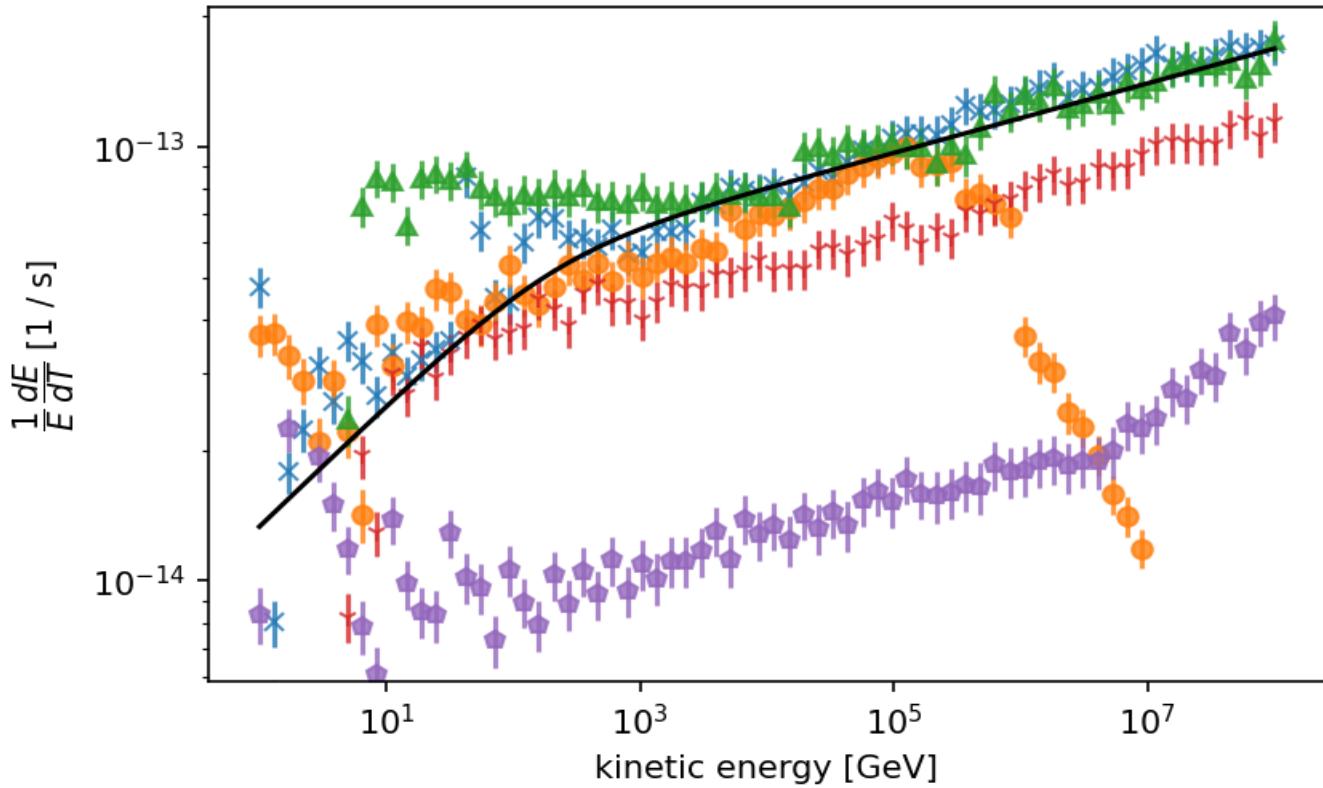

Energy loss sampling

- 10^5 particles per primary energy
- Primary (kinetic energy) $1 \leq \frac{T_p}{\text{GeV}} \leq 10^8$ with 70 points in logspace
- Density $n_H = 10^8 \text{ m}^{-3}$
- Propagate only one step with $\Delta s = 0.01 \lambda_{\text{mfp}}$

$$\frac{dE}{dT} \approx \frac{\Delta E}{\Delta s/c}$$

Energy loss

application

Giant Molecular Cloud

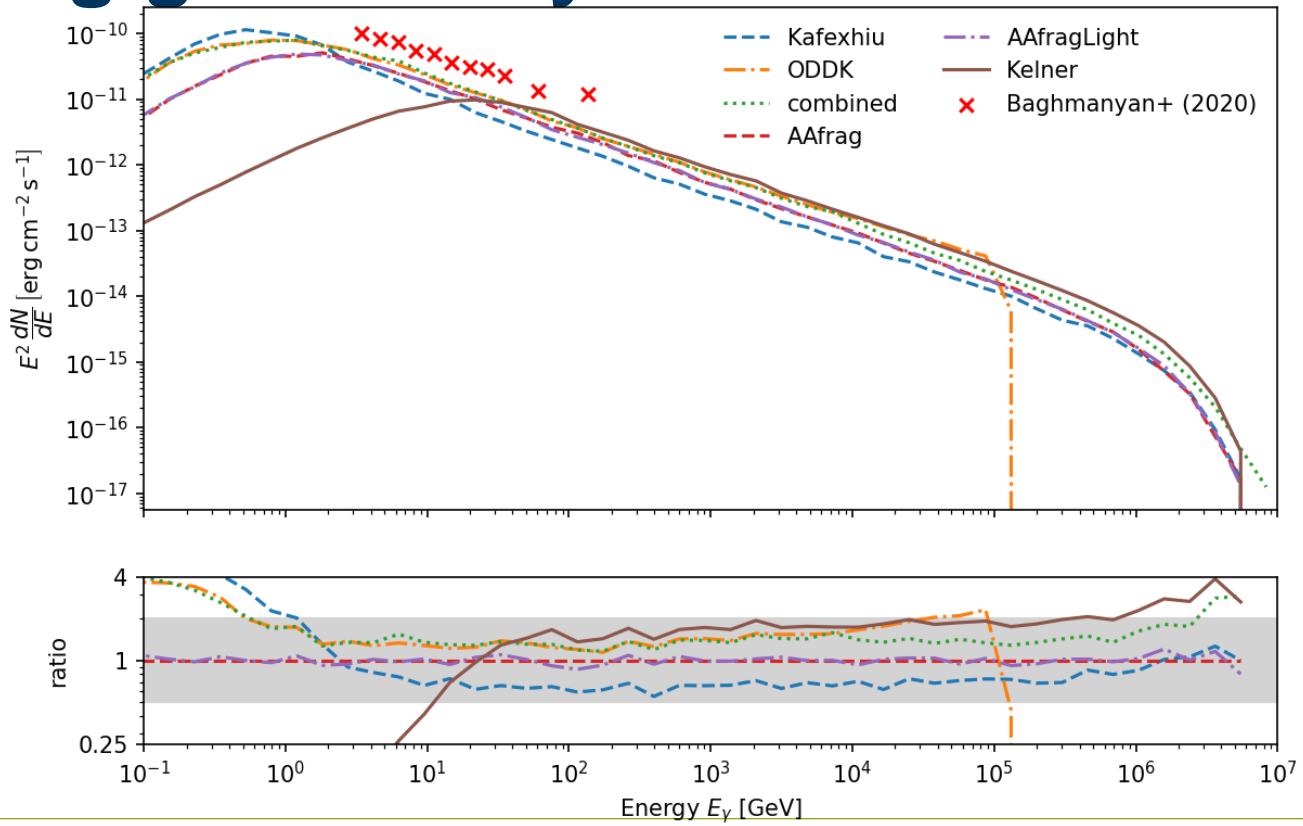

Giant Molecular Cloud – Rho Oph

- Spherical dens cloud $n(r) = \frac{n_0}{1 + \frac{r}{R_0}}$
- Injection on a sphere around the cloud
- 10^8 particles with $1 \text{ GeV} \leq T_p \leq 10^7 \text{ GeV}$
- Direct detection of created γ -rays
- Injection spectrum reweighted to LIS

$$j_p(E) = 2.3 E^{1.12} \beta^{-2} \left(\frac{E + 0.67 \text{ GeV}}{1.67 \text{ GeV}} \right)^{-3.93} \frac{\text{particle}}{\text{GeV m}^2 \text{ s sr}}$$

Resulting gamma-ray flux

conclusion

Conclusion

- p-p interactions as a plug-in with custom secondaries
- Input: pre tabulated cross section for each secondary
- Tables available for: AAfrag, Kafexhiu, Kelner, ODDK
- Plug in tested for yields and energy loss
- results for different models with an uncertainty ~ 2 for astrophysical application

Backup slides

Differential cross-section models - Kelner

Paper:

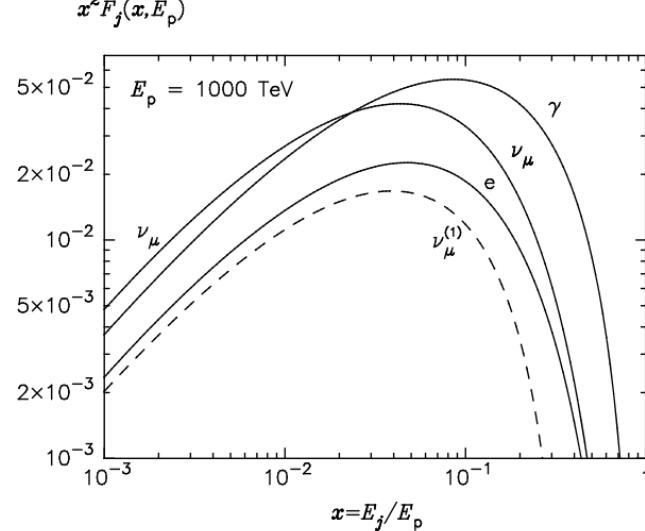

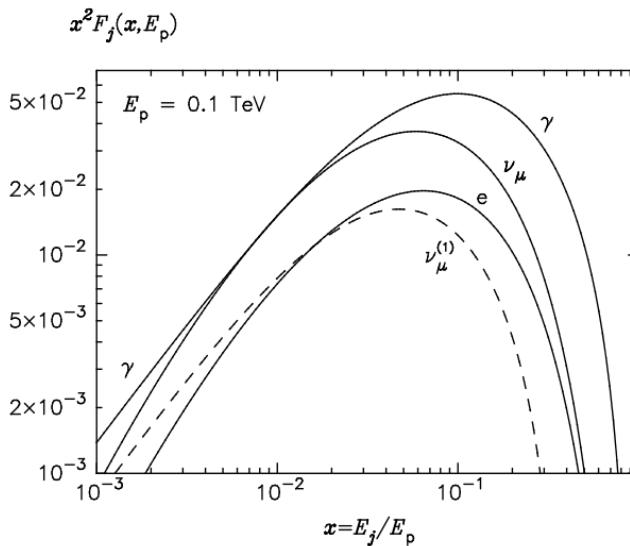

Kelner et al., PRD (2006) 034018, 74(3)

Energy range:

$$100 \text{ GeV} < T_p < 10^5 \text{ TeV} \quad 10^{-3} \leq \frac{\epsilon}{T_p} \leq 1$$

Included secondaries:
interaction:

$$e^\pm \text{ (one species)}, \nu_e, \nu_\mu^{(1)}, \nu_\mu^{(2)} \quad \text{or} \quad \pi^{\pm,0}$$

Differential cross-section models - Kafexhiu

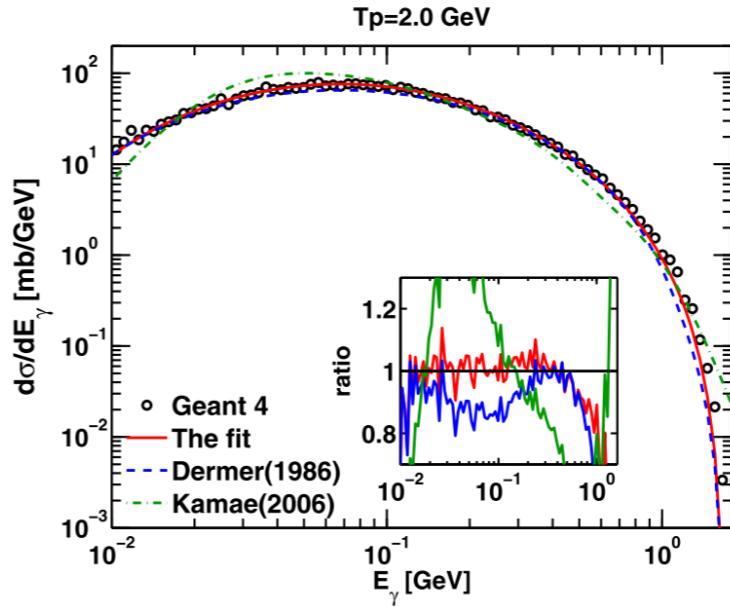

Paper:

Kafexhiu et al. PRD 90, 123014 (2014)

Included secondaries: γ

interaction: p-p

- Includes the $1\pi^0$ and $2\pi^0$ channel
- Different parameters for different event generators

Differential cross-section models - ODDK

Paper:

Orusa et al. (2022, 2023)

Energy range:

$$100 \text{ MeV} < T_p^{(e)} < 10^3 \text{ TeV}$$
$$10 \text{ MeV} < \epsilon_e \leq 10 \text{ TeV}$$

$$100 \text{ MeV} < T_p^{(\gamma)} < 10^4 \text{ TeV}$$
$$10 \text{ MeV} < \epsilon_\gamma \leq 100 \text{ TeV}$$

Included secondaries:
interaction:

e^\pm (separate), γ
projectile: ${}^1\text{H}$, ${}^2\text{H}$, ${}^3\text{He}$, ${}^4\text{He}$, ${}^{12}\text{C}$, ${}^{13}\text{C}$, ${}^{14}\text{N}$, ${}^{15}\text{N}$, ${}^{16}\text{O}$
target: p, He

Differential cross-section models - AAfrag

Paper:

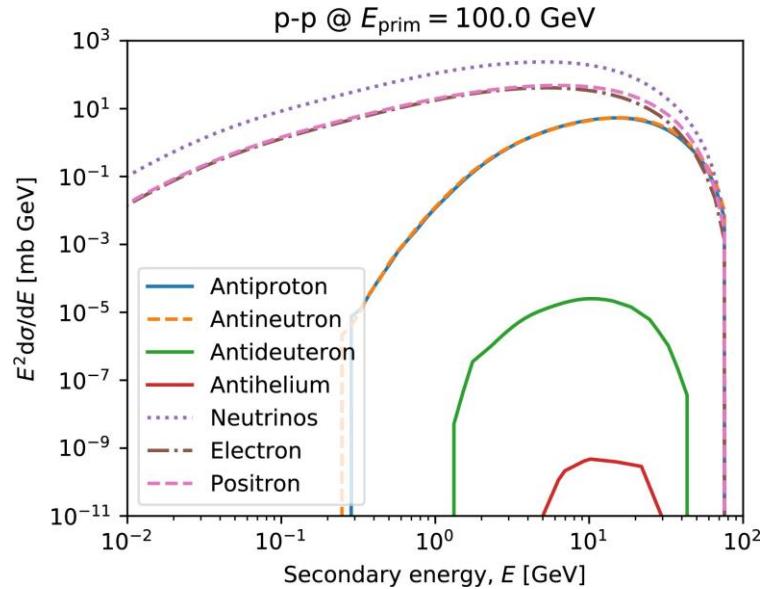

Kachelrieß et al, (2019), Computer Physics Communications, 245, 106846

Included secondaries:

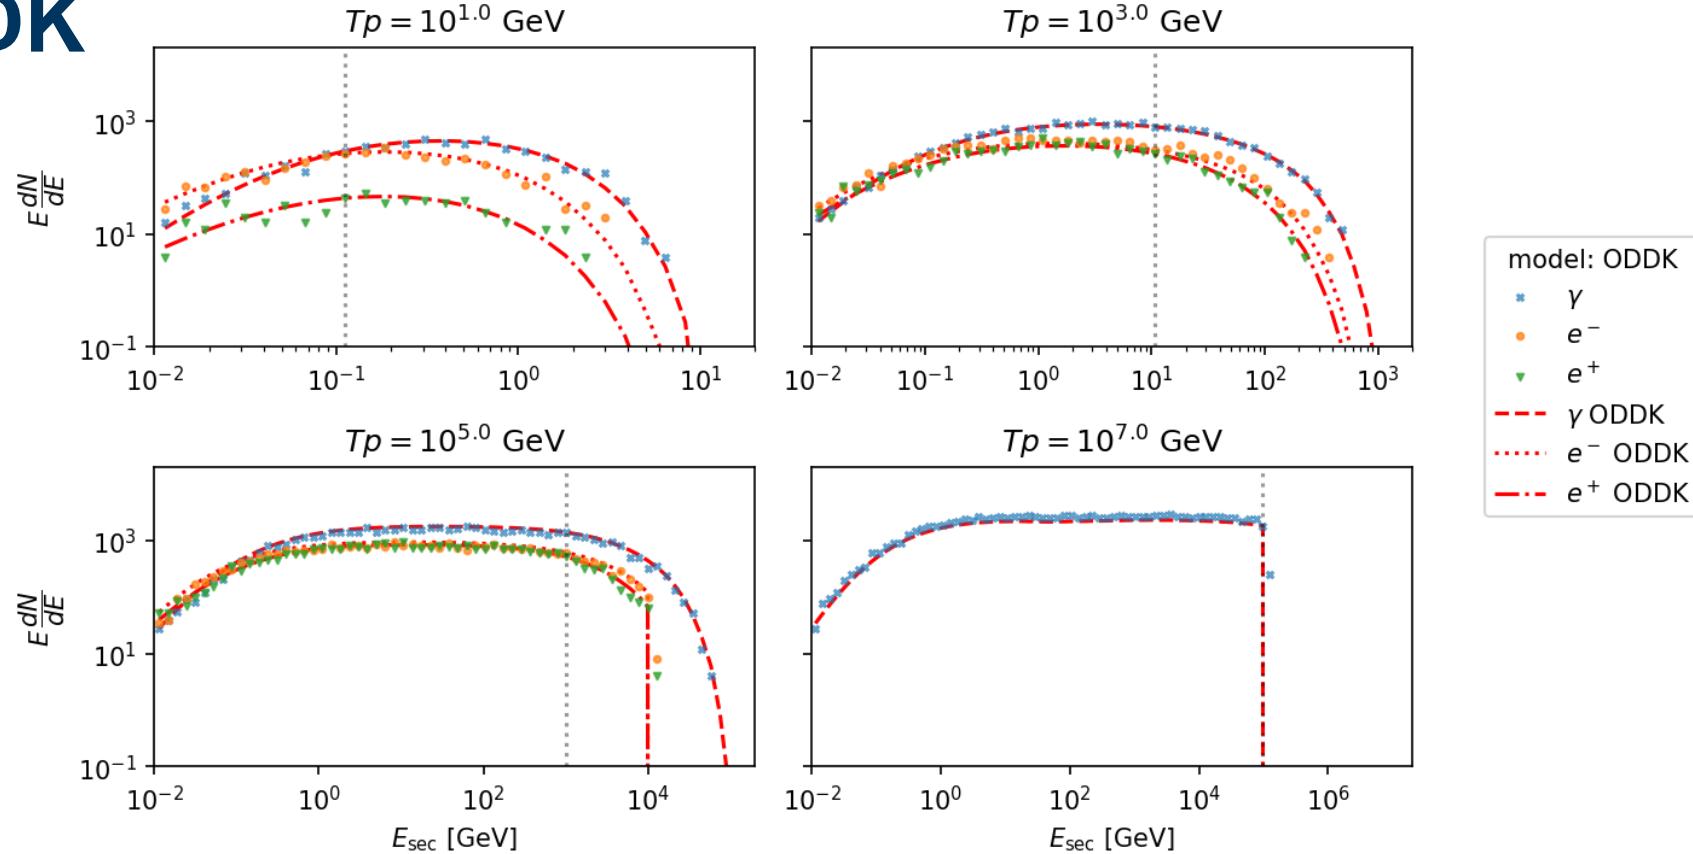

e^- , ν_e , ν_μ , γ , p , n , \bar{d} , ${}^3\overline{\text{He}}$, ${}^3\overline{\text{H}}$

interaction:

p-p, p-He, He-p, He-He, C-p, Al-p, Fe-p, \bar{p} -p, \bar{p} -p

ODDK
