Thermal-Nonthermal Separation in CHANG-ES data

Monday April 24, 2023, 11am / GAFO 03/252

With the advent of new S-band data, the possibility of separating thermal from non-thermal emission presents itself. If successful, then the need for additional Halpha and IR observations for the purpose of such separation may be eliminated. This talk will focus on some attempts to do that, and present some preliminary results.
